Vegetable Gardening

7
Review questions

1. What factors should you consider when choosing a garden site?

2. Which factor is most important for seed germination in the spring—soil temperature or air temperature?

3. In cold situations (e.g., spring and fall), what can you do to extend the growing season?

4. Suppose you plant the same crop in a sandy soil, a loam soil, and a clay soil, and apply the same amount of water at each irrigation. Which site would need to be watered more often?

5. What is a good way to build soil fertility while protecting your soil from leaching and compaction during the winter rainy season?
